20. ABSTRACT (Continue on reverse side if necessary and identify by block number)  It is the intent of this report to extend and improve the tables already available (CRREL Special Report 108, G.W. Aitken, 1966). The computational method is described with discussion of error, improved methods, and limitations. The tables are presented in two sections: the first for temperatures in the range -184°C to 0°C, the second for temperatures in the range 0°C to 100°C. The corresponding Fahrenheit temperatures are also included.		

IMPROVED MILLIVOLT-TEMPERATURE CONVERSION TABLES  
FOR COPPER-CONSTANTAN THERMOCOUPLES  
32° F Reference Temperature

by

P.E. Stallman and K. Itagaki

INTRODUCTION

It is the intent of this report to extend and improve the tables already available (CRREL Special Report 108, G.W. Aitken, 1966). The computational method is described with discussion of error, improved methods, and limitations. The tables are presented in two sections: the first for temperatures in the range  $-184^{\circ}\text{C}$  to  $0^{\circ}\text{C}$ , the second for temperatures in the range  $0^{\circ}\text{C}$  to  $100^{\circ}\text{C}$ . The corresponding Fahrenheit temperatures are also included.

PROCEDURE

The relationship of the emf produced by copper-constantan and the temperature is not well represented by a single function. Therefore, for the purpose of generating these tables, two cubic equations with different sets of constants ( $A_1, B_1, C_1$ ) and ( $A_2, B_2, C_2$ ) were used. The cubic equation is

$$e = A_i t + B_i t^2 + C_i t^3 \quad (1)$$

where  $i = 1, 2$ ,  $e =$  emf in millivolts, and  $t =$  temperature in  $^{\circ}\text{C}$ .

The constants  $A_i, B_i$  and  $C_i$  in eq 1 were obtained by using the least squares polynomial curve fit subroutine in the Dartmouth College GE 625 computer.\* The input for the fitting function to obtain the constants  $A_1, B_1, C_1$  and  $A_2, B_2, C_2$  was National Bureau of Standards Data (1955) from  $-190^{\circ}\text{C}$  to  $0^{\circ}\text{C}$  and  $0^{\circ}\text{C}$  to  $100^{\circ}\text{C}$  respectively. All points given in the NBS tables in these ranges were used for the fits. The constants obtained from these fits were

$$A_1 = 3.84971 \times 10^{-2}$$

$$A_2 = 3.84256 \times 10^{-2}$$

$$B_1 = 4.62204 \times 10^{-5}$$

$$B_2 = 4.72065 \times 10^{-5}$$

$$C_1 = -3.88666 \times 10^{-8}$$

$$C_2 = -3.76875 \times 10^{-8}$$

---

\* This subroutine was written by L.C. Semprebon, Radiophysics Laboratory, Dartmouth College.

These constants were then incorporated into a computer program using the cosine method for the solution of the cubic equation (Weast et al., 1965). Thus, eq 1 is rearranged such that

$$t^3 + \frac{B}{C} t^2 + \frac{A}{C} t - \frac{e}{C} = 0. \quad (2)$$

Define  $p = \frac{B}{C}$ ,  $q = \frac{A}{C}$ ,  $r = \frac{-e}{C}$ ,

let  $t = x - \frac{p}{3}$  (3)

then  $x^3 + ax + b = 0$  (4)

where  $a = \frac{1}{3} (3q - p^2)$  and  $b = \frac{1}{27} (2p^3 - 9pq + 27r)$ .

For the cosine solution  $\phi$  is calculated by

$$\cos \phi = \frac{-(2p^3 - 9pq)}{54 \sqrt{\frac{-a^3}{27}}} - \frac{r}{\sqrt{\frac{-a^3}{27}}}. \quad (5)$$

Then the particular solution for  $x$  is calculated using

$$x = 2 \sqrt{\frac{-a}{3}} \left( \cos \frac{\phi}{3} + 120^\circ \right). \quad (6)$$

Substituting in eq 3, the temperature in  $^\circ\text{C}$  is obtained.

#### DISCUSSION

As mentioned previously, a single function does not represent the emf-temperature relationship very well, and this was the reason for the two different fits. Even by using two fitting equations, there are some points that lie beyond a 0.5-microvolt confidence interval as shown in Figure 1. The main reason for this deviation from the NBS data is the rounding of the NBS values as well as the rounding of these tables to the nearest hundredth of a degree. Further information on rounding and improved methods using second degree Lagrange interpolation is given in the paper by Benedict and Ashby (1962).

The tables given here are limited by the rounding discussed above and the physical limits of error produced by copper-constantan thermocouples.\* Considering these limitations, copper-constantan is preferred for work in the area covered by this table, in particular those temperatures below  $-50^\circ\text{C}$  (Powell et al., 1962).

\* ASTM Standards lists the limits of error for copper-constantan thermocouples between  $-75^\circ\text{F}$  and  $200^\circ\text{F}$  as  $\pm 1\text{-}1/2^\circ\text{F}$  for standard wire and  $\pm 3/4^\circ\text{F}$  for special wire. For the range  $-300^\circ\text{F}$  to  $-75^\circ\text{F}$  the limits are given for special wire only as  $\pm 1\%$  of the temperature measure.
