Final report

Approved for public release; distribution is unlimited.

Prepared for U.S. Army Corps of Engineers
Washington, DC 20314-1000

Under System-Wide Water Resources Program

Abstract: The present report is one of a series that documents research relating the coupling of spatially and temporally detailed eutrophication models with ecosystem models that lack spatial and temporal resolution. Specifically, the Corps of Engineers Integrated Compartment Water Quality Model (CE-QUAL-ICM) is coupled to the Ecopath with Ecosim (EWE) fisheries model. Previous reports in this series introduced the concepts necessary for communication between the two models and detailed the linkage. The previous linkage relied on a “human interface” between the two models. That is, information from CE-QUAL-ICM was printed and entered into the EWE input screen by hand. This process has been replaced by a graphical user interface (GUI), which is documented herein.

Preface

This work was conducted under funding from the System Wide Water Resources Program (SWWRP). Dr. Steven L. Ashby is Program Manager of SWWRP. The work was conducted under the direction supervision of Dr. Barry W. Bunch, Chief, Water Quality and Contaminant Modeling Branch, Environmental Laboratory (EL), U. S. Army Engineer Research and Development Center (ERDC), Vicksburg, MS.

This report was prepared by Carl F. Cerco, Dorothy H. Tillman, and Terry K. Gerald of the Water Quality and Contaminant Modeling Branch, EL, ERDC. At the time of publication of this report, Dr. Beth Fleming was Director of EL.

COL Gary E. Johnston was Commander and Executive Director of ERDC. Dr. James R. Houston was Director.

1 Introduction

The present report is one of a series that documents research relating the coupling of spatially and temporally detailed eutrophication models with ecosystem models that lack spatial and temporal resolution. Specifically, the Corps of Engineers Integrated Compartment Water Quality Model (CE-QUAL-ICM, Cerco and Meyers 2000) is coupled to the Ecopath with Ecosim (EWE) fisheries model (Christensen et al. 2000). Previous reports in this series introduced the concepts necessary for communication between the two models (Tillman et al. 2006) and detailed the linkage (Cerco and Tillman 2008). The previous linkage relied on a “human interface” between the two models. That is, information from CE-QUAL-ICM was printed and entered into the EWE input screen by hand. This process has been replaced by a graphical user interface (GUI), which is documented herein.

Linkage schematic

The linkage (Figure 1) relies on a number of computer executable, input, and output files. The **ICM Executable** is the compiled version of CE-QUAL-ICM as applied to the subject water body. **Ecopath** is the basic steady-state, spatially averaged foundation of EWE. The ICM Executable produces a KFL Output file. The **KFL Output** file is a binary file that contains the information to be passed to EWE. The KFL Output file is read by a **KFL Postprocessor**, which is assembled from several components including the main routines, routines which relate specific versions of ICM and EWE, and modules that define variables and array sizes. The **.ecm** file is an ASCII file, prepared by the user, which associates variable names between ICM and Ecopath. The **.eco file** is produced by the KFL post-processor and conveys information from ICM into the graphical user interface. The **.eii** file is an Ecopath file used for importing and exporting information. The .eco and .eii files are input to the **GUI**, which manages the exchange of information between the two models. The GUI creates a new .eii file, which contains selected information from ICM and is read back into Ecopath.

Figure 1. Flow chart for exchanging information between ICM and Ecopath.

Code versions

The version of ICM described here contains the features developed for the 2002 application to Chesapeake Bay (Cerco and Noel 2004). For development purposes, the code is applied on the 4,000-cell grid employed in the original Chesapeake Bay application (Cerco and Cole 1994). The KFL file is a binary file that must be compatible (format, array dimensions) with the KFL postprocessor, which is coded in FORTRAN 90. EWE is version 5.1 (Christensen et al. 2000), downloaded as a Windows PC executable from the Ecopath with Ecosim web site (www.ecopath.org). The Ecopath application to Chesapeake Bay was developed by Hagy (2002) and was provided by the author. The GUI is coded in C# and operates in the Windows PC environment.

2 Linking the Ecopath Model of ICM

Background

For development and debugging purposes, an Ecopath model of the ICM carbon cycle was created. This simplified Ecopath model also provides a good introduction to the GUI.

Step-by-step instructions

1. Execute the ICM model and create a KFL file.
2. Start EWE and export an .eii file based on the model of the ICM carbon cycle.
3. The names of the .ecm and .eco files are hardwired in the KFL post-processor. Edit file `kfl_cfcs_4000cell.f` and ensure the correct files are specified (`ecm_input_file = 'fort.gui_4000V2.ecm'`, `eco_output_file = 'fort.gui_4000V2.eco'`).
4. Compile the postprocessor (Figure 2).
5. The postprocessor opens file `'wqm_kfl.opt'`. Link the KFL output file to `wqm_kfl.opt`. (`ln -s wqm_kfl.sav_fix wqm_kfl.opt`).
6. Execute the postprocessor (`./postpro_4000`). The postprocessor uses two auxiliary input files. File `KFL_postpro_area.npt` lists the surface cells in the ICM grid that are to be averaged into a single Ecopath domain. File `sbox_col.dat` lists the cells that underlie the surface cells listed in `KFL_postpro_area.npt`. The postprocessor creates two output files. File `KFL_postpro_area_4000.opt` is an ASCII listing of postprocessed information. This material was previously entered into Ecopath by hand. File `fort.gui_4000V2.eco` is the information input directly to the GUI.
7. Postprocessing is conducted on the same machine on which ICM is executed. If this machine is not the PC on which Ecopath is operated, the .eco file should be transferred to the PC.
8. Start the GUI by double-clicking on the `IcmEcoViewer` icon. Go to the "File" heading and open the ICM file (Figure 3). Go to the "File" heading again and open the `EcoPath eii` file.

Figure 2. Linux shell to compile the KFL postprocessor.

Figure 3. Opening the .eco and .eii files in the IcmEcoViewer GUI.

Transferring basic kinetics

Information may be transferred from ICM into three Ecopath screens, the Basic Kinetics screen, the Diet Composition screen, and the Detrital Fate screen. Proceed as follows to transfer information to the Ecopath Basic Kinetics screen.

1. Double-click on “Basic Kinetics” in the upper right-hand list. A screen entitled “ICM Basic Kinetics Dialog” will appear. (If not visible, look under the “Eco-Icm Exchange” window.) Double-click on the information to transfer to Ecopath. These entries will be highlighted in red (Figure 4).

2. Click in the “Basic Kinetics” box under the “Transfer” heading.
3. Click the “Execute Transfer” bar. A “Transfer Summary Report” will appear. This report can be dismissed.
4. Click the file header and then click the “Save EcoPath eii file” option. Provide a name (such as Test_1) and click the “Save” bar.
5. Activate Ecopath and click the “File” header. Click on the “Import Text (.eii)” option and navigate to the folder where the output from the GUI is stored.
6. Open the .eii file produced by the GUI. The items selected in Step 1 should appear in the Ecopath “Basic Kinetics” screen (Figure 5).

Figure 4. Selecting “Basic Kinetics” information to be transferred from ICM to Ecopath.

Figure 5. Ecopath after importing "Basic Kinetics" information from the "ICM Basic Kinetics Dialog."

Transferring diet composition

1. Double-click on "Diet Composition" in the upper right-hand list. A screen entitled "ICM Diet Composition Dialog" will appear. (If not visible, look under the "Eco-Icm Exchange" window.) Double-click on the information to transfer to Ecopath. These entries will be highlighted in red (Figure 6).
2. Click in the "Diet Composition" box under the "Transfer" heading.
3. Click the "Execute Transfer" bar. A "Transfer Summary Report" will appear. This report can be dismissed.
4. Click the file header and then click the "Save EcoPath eii file" option. Provide a name (such as Test_2) and click the "Save" bar.
5. Activate Ecopath and click the "File" header. Click on the "Import Text (.eii)" option and navigate to the folder where the output from the GUI is stored.
6. Open the .eii file produced by the GUI. The items selected in Step 1 should appear in the Ecopath "Diet Composition" screen (Figure 7). (Note that the screens are transposed between the GUI and Ecopath.)

Figure 6. Selecting “Diet Composition” information to be transferred from ICM to Ecopath.

Figure 7. Ecopath after importing “Diet Composition” information from the “ICM Diet Composition Dialog.”

Transferring detrital fate

1. Double-click on “Detrital Fate” in the upper right-hand list. A screen entitled “ICM Detrital Fate Dialog” will appear. (If not visible, look under the “Eco-Icm Exchange” window.) Double-click on the information to transfer to Ecopath. These entries will be highlighted in red (Figure 8).
2. Click in the “Detrital Fate” box under the “Transfer” heading.
3. Click the “Execute Transfer” bar. A “Transfer Summary Report” will appear. This report can be dismissed.
4. Click the file header and then click the “Save EcoPath eii file” option. Provide a name (such as Test_3) and click the “Save” bar.
5. Activate Ecopath and click the “File” header. Click on the “Import Text (.eii)” option and navigate to the folder where the output from the GUI is stored.
6. Open the .eii file produced by the GUI. The items selected in Step 1 should appear in the Ecopath “Detritus Fate” screen (Figure 9). (Note that the columns are ordered differently in the GUI and Ecopath.)

Figure 8. Selecting “Detritus Fate” information to be transferred from ICM to Ecopath.

Figure 9. Ecopath after importing "Detritus Fate" information from the "ICM Detritus Fate Dialog."

Important reminder

Application of the Ecopath model largely amounts to balancing diet composition and other parameters such that a balance is attained and all "Ecotrophic Efficiencies" remain less than unity. If the Ecopath application is balanced prior to importing information from ICM, the application will likely have to be re-balanced after new information is imported. When an .eii file is saved, an "Important Reminder" message appears which cautions the user to check mass balances when returning to Ecopath. Clicking the "OK" bar will dismiss the reminder.

3 Linking the Ecopath Model of Chesapeake Bay

Introduction

For operational purposes, ICM is linked to an Ecopath model of Chesapeake Bay (Hagy 2002). Transferring information largely follows the procedure outlined in Chapter 2 with a few exceptions necessitated by differences in state variables and units between ICM and Ecopath. ICM represents the summer phytoplankton population in Chesapeake Bay as a single group. Ecopath employs two groups: Picoplankton and Net Phytoplankton. During the transfer process the ICM phytoplankton biomass is split 80 percent Net Phytoplankton and 20 percent Picoplankton. Production-to-biomass ratios and other parameters from the single ICM group are used for both Ecopath groups. ICM employs a single microzooplankton group, while Ecopath has three: Ciliates, Rotifers, and Merozooplankton. The biomass of the single ICM group is split equally into the three Ecopath groups. Production-to-biomass ratios and other parameters from the single ICM group are used for all three Ecopath groups. These splits are specified in the .ecm file (kfl_for_hagy.ecm). The ICM biomass unit is g C while Ecopath employs mg C. The units conversion is specified in the GUI as explained below.

Step-by-step instructions

1. Execute the ICM model and create a KFL file.
2. Start EWE and export an .eii file based on the model of Chesapeake Bay.
3. The names of the .ecm and .eco files are hardwired in the KFL postprocessor. Edit file kfl_cfcs_4000cell.f and ensure the correct files are specified (ecm_input_file = 'hagyV2.ecm', eco_output_file = 'hagyV2.eco')
4. Compile the postprocessor (Figure 2).
5. The postprocessor opens file 'wqm_kfl.opt'. Link the KFL output file to wqm_kfl.opt. (ln -s wqm_kfl.sav_fix wqm_kfl.opt).
6. Execute the postprocessor (./postpro_4000). The postprocessor uses two auxiliary input files. File KFL_postpro_area.npt lists the surface cells in the ICM grid that are to be averaged into a single Ecopath domain. File sbbox_col.dat lists the cells that underlie the surface cells

listed in KFL_postpro_area.npt. The postprocessor creates two output files. File KFL_postpro_area_4000.opt is an ASCII listing of post-processed information. This material was previously entered into Ecopath by hand. File hagyV2.eco is the information input directly to the GUI.

7. Postprocessing is conducted on the same machine on which ICM is executed. If this machine is not the PC on which Ecopath is operated, the .eco file should be transferred to the PC.
8. Start the GUI by double-clicking on the IcmEcoViewer icon. Go to the “File” heading and open the ICM file (Figure 3). Go to the “File” heading again and open the EcoPath eii file.

Transferring basic kinetics

Proceed as follows to transfer information to the Ecopath Basic Kinetics screen.

1. Double-click on “Basic Kinetics” in the upper right-hand list (Figure 4). A screen entitled “ICM Basic Kinetics Dialog” will appear. (If not visible, look under the “Eco-Icm Exchange” window.) Double-click on the information to transfer to Ecopath. These entries will be highlighted in red.
2. A box entitled “Biomass Multiplier” is situated in the lower left of the “ICM Basic Kinetics Dialog.” Enter 1000 to convert g C to mg C and click the “Calculate” button (Figure 10).
3. Click in the “Basic Kinetics” box under the “Transfer” heading.
4. Click the “Execute Transfer” bar. A “Transfer Summary Report” will appear. This report can be dismissed.
5. Click the file header and then click the “Save EcoPath eii file” option. Provide a name (such as Test_1) and click the “Save” bar.
6. Activate Ecopath and click the “File” header. Click on the “Import Text (.eii)” option and navigate to the folder where the output from the GUI is stored.
7. Open the .eii file produced by the GUI. The items selected in Step 1 should appear in the Ecopath “Basic Kinetics” screen (Figure 11).

Figure 10. The “ICM Basic Kinetics Dialog” including a biomass conversion.

Figure 11. Ecopath model of Chesapeake Bay after importing “Basic Kinetics” information from the “ICM Basic Kinetics Dialog.”

Transferring diet composition

1. Double-click on “Diet Composition” in the upper right-hand list. A screen entitled “ICM Diet Composition Dialog” will appear. (If not visible, look under the “Eco-Icm Exchange” window.) Double-click on the information to transfer to Ecopath. These entries will be highlighted in red (Figure 12).
2. Click in the “Diet Composition” box under the “Transfer” heading.
3. Click the “Execute Transfer” bar. A “Transfer Summary Report” will appear. This report can be dismissed.
4. Click the file header and then click the “Save EcoPath eii file” option. Provide a name (such as Test_2) and click the “Save” bar.
5. Activate Ecopath and click the “File” header. Click on the “Import Text (.eii)” option and navigate to the folder where the output from the GUI is stored.
6. Open the .eii file produced by the GUI. The items selected in Step 1 should appear in the Ecopath “Diet Composition” screen (Figure 13). (Note that the screens are transposed between the GUI and Ecopath.)

Figure 12. Selecting “Diet Composition” information to be transferred from ICM to the Ecopath model of Chesapeake Bay.

Figure 13. Ecopath model of Chesapeake Bay after importing “Diet Composition” information from the “ICM Diet Composition Dialog.”

Transferring detrital fate

1. Double-click on “Detrital Fate” in the upper right-hand list. A screen entitled “ICM Detrital Fate Dialog” will appear. (If not visible, look under the “Eco-Icm Exchange” window.) Double-click on the information to transfer to Ecopath. These entries will be highlighted in red (Figure 14).
2. Click in the “Detrital Fate” box under the “Transfer” heading.
3. Click the “Execute Transfer” bar. A “Transfer Summary Report” will appear. This report can be dismissed.
4. Click the file header and then click the “Save EcoPath eii file” option. Provide a name (such as Test_3) and click the “Save” bar.
5. Activate Ecopath and click the “File” header. Click on the “Import Text (.eii)” option and navigate to the folder where the output from the GUI is stored.
6. Open the .eii file produced by the GUI. The items selected in Step 1 should appear in the Ecopath “Detritus Fate” screen (Figure 15). (Note that the columns are ordered differently in the GUI and Ecopath.)
